

Lwasp Tutorial

1

Download the lwasp folder from the CyberPatriot website (<https://www.uscyberpatriot.org/lwasp>)

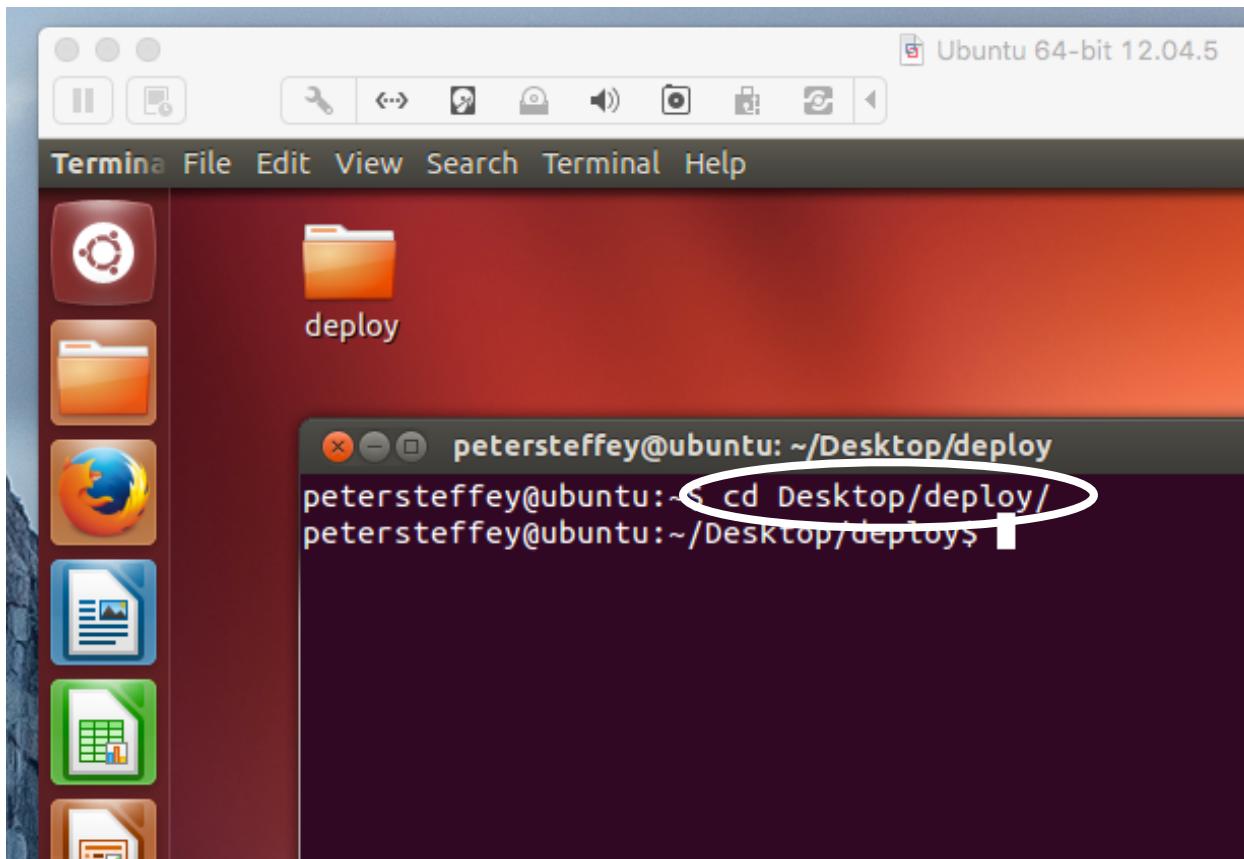

2

Move the internal deploy folder into the virtual machine. It doesn't matter where you put it on the VM.

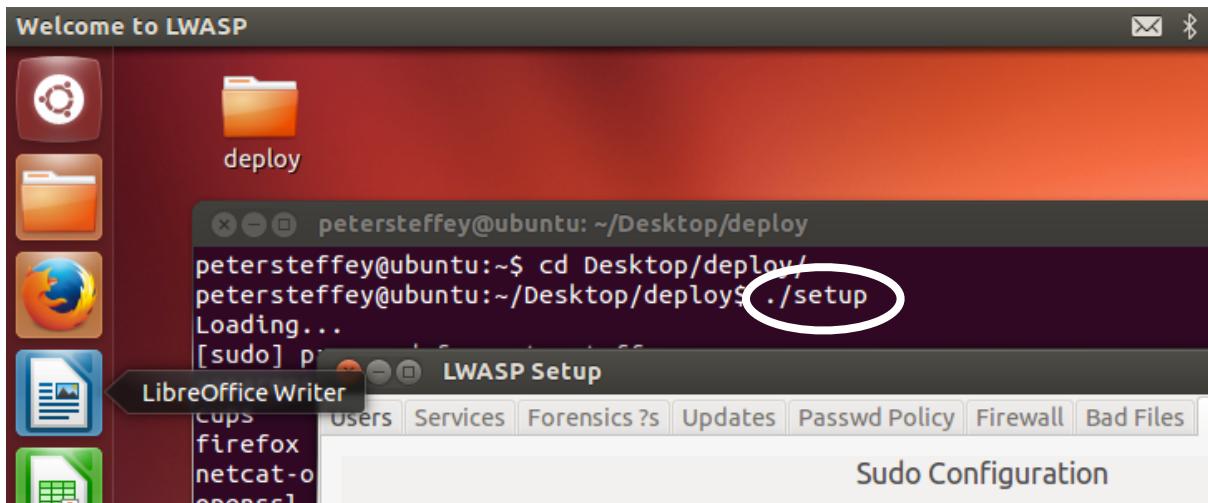

3

Open a terminal on the VM, and cd (change directory) into the folder.

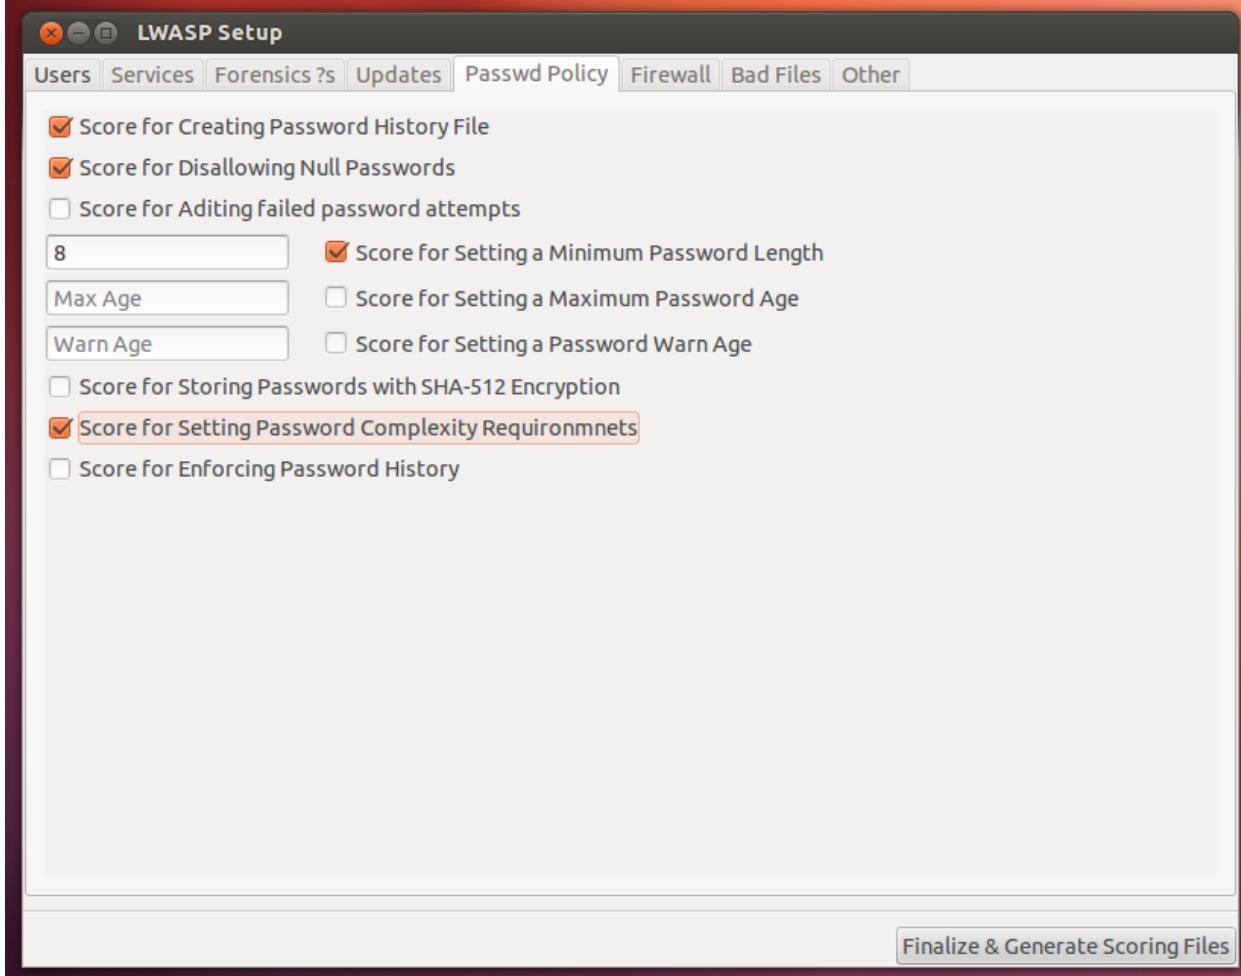

4

Run the command: ./setup

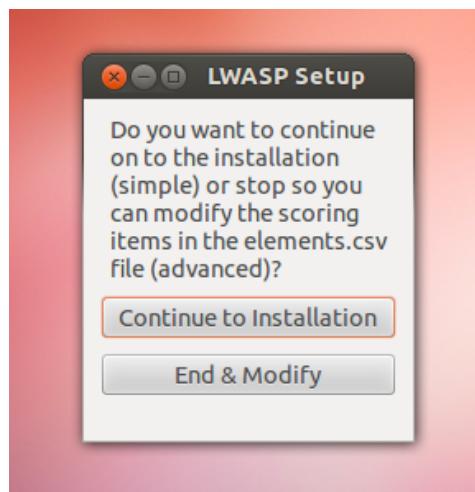

5

Simply check what you want to score for each category, then press the “Finalize & Generate Scoring Files” Button at the bottom right corner.

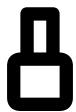

6

Unless you are an advanced user and intend to modify the elements.csv file, you should Continue to Installation.

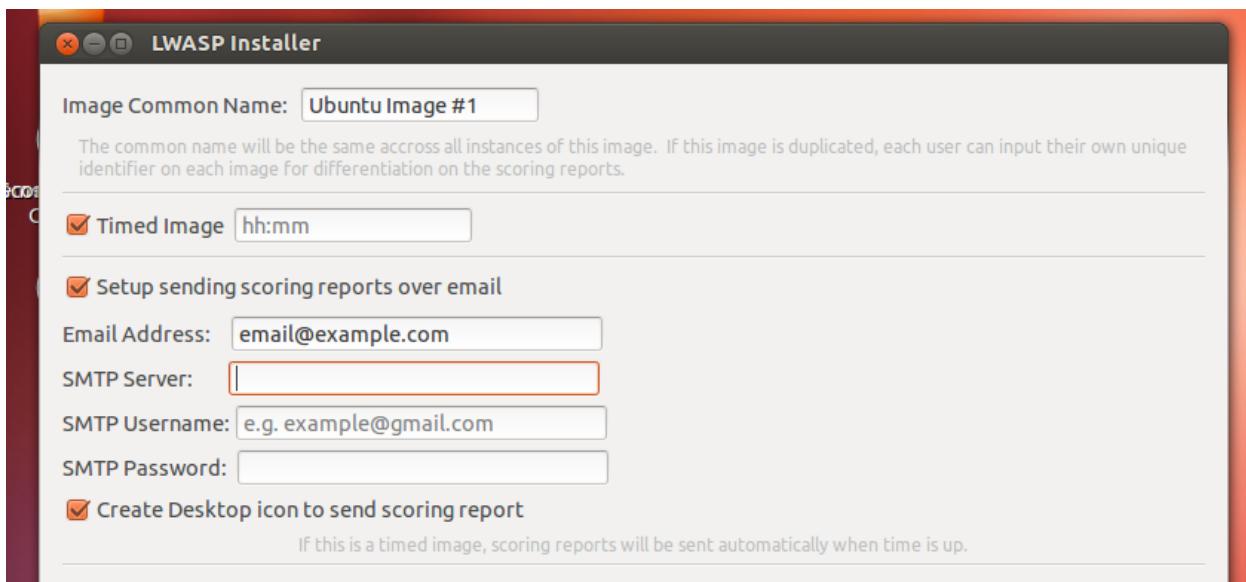

7

Press the Install button...

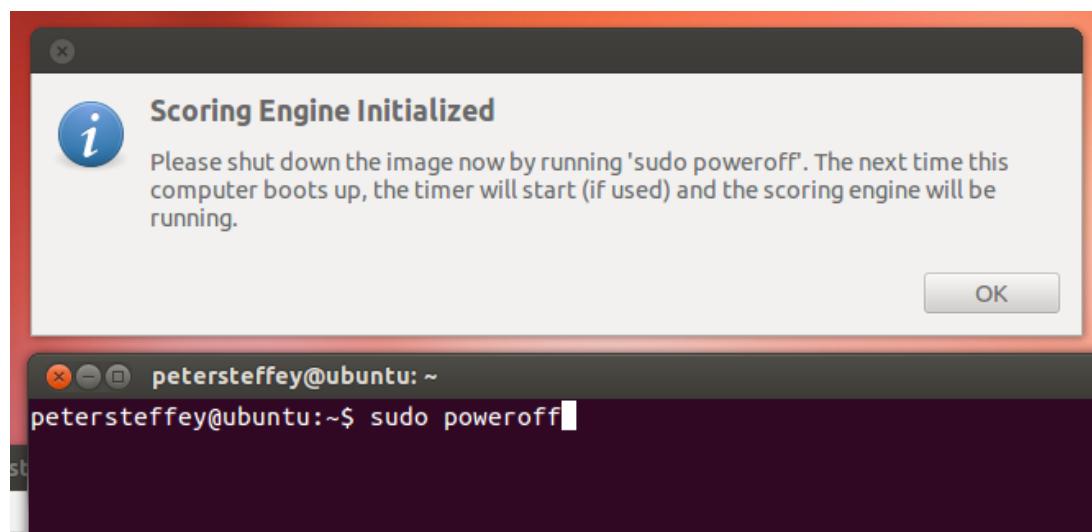

Input the needed information...

8

Shutdown the image using the command: sudo poweroff

10

Distribute the image to all of the competitors, and then run them using VMWare Player or VSphere Client on Windows, or VMWare Fusion on Mac

11

As noted on the scoring report, each competitor should run the Set ID program on the desktop, so that you, as the coach or mentor, can differentiate between the scoring reports from various competitors. This will usually be a competitor's name or some other sort of identifier.

12

If you enabled email reporting, the scoring report will be emailed to you either when the time is run out, or, if enabled, when the competitor runs the Send Scoring Report program on the desktop. If you did not enable email reporting, the competitors can send you pictures or a web archive of their scoring report.

13

Email any feedback or feature requests about the LWASP scoring engine to steffeydev@icloud.com
